

229 access points live in a working distribution center.

Family Dollar needed full wireless coverage across its Odessa, TX distribution center. Prime-Net partnered with Connexx to deliver the infrastructure and the access layer in an eight-week window.

THE CHALLENGE

A distribution center is not a store. Coverage has to hold across high-bay racking, dock doors, and open floor; the building never stops moving freight, and the network gear feeding it has to be in place before a single access point comes online.

WHAT PRIME-NET DID

Working alongside Connexx, Prime-Net installed 229 access points throughout the Odessa facility, pulled more than 20 new fiber runs back to the IDF cabinets, and built out two additional cabinets where the existing infrastructure had no room left. Backbone first, access layer second, all inside an eight-week window.

THE RESULT

Family Dollar got wireless coverage across the full facility and the fiber backbone to support it, delivered without interrupting distribution center operations.
