

449 clinics powered for new equipment in five months.

Milan Laser Hair Removal needed new treatment equipment energized at every clinic in the country, on a schedule that kept patient appointments running.

THE CHALLENGE

Milan Laser was deploying a Zimmer Cryo air-chilling system alongside the primary laser at every clinic. Each location needed two new electrical outlets to support it, and no two buildings were wired the same way. The equipment could not be commissioned until the power was in place.

WHAT PRIME-NET DID

Prime-Net ran dedicated circuits for the new equipment at all 449 clinics, adding sub-panels wherever the existing service could not carry the additional load. Crews worked to a single scope and a consistent standard, maintaining a pace of roughly 20 clinics per week across the country.

THE RESULT

Every clinic in the network was ready for its new equipment within five months, with the electrical work handled by one accountable partner instead of 449 separate local contractors.
